

SERVERSOUND™

ProMaster Software Mastering Suite for ServerSound!

A full kit of powerfully automated mastering tools that make it easy to add new audio to your centralized hard disc library. Whether your ripping audio from a SFX CD, or finally transferring all those great effects you've been stockpiling on DAT or 1/4-inch tape.

Tools Include:

mSoft MASTERING STATION

All the tools you need for mastering from commercially available library CDs. The *mSoft Mastering Station* includes a sophisticated *audio ripper*, an automated index slicing tool, and a database editor.

Sound effect CD's are generally full of indexes, which can result in hours of work separating the tracks into their individual indexes. With the automated indexing tool you can slice all the tracks on a SFX CD into individual indexes, a simple job of a few minutes rather than a laborious task of many hours.

Also, *mSoft Mastering Station* provides an *editor* that lets you create new library databases, as well as edit existing ones.

CD COPY

CD Copy is a stand alone "CD Audio Ripper" that can be used on any PC client computer with a high quality CD-ROM reader. The newly transferred audio can then be downloaded over the system's network to the ServerSound Server computer for final mastering and mapping.

"ServerSound became a very important business and artistic tool within days of installation. It is superfast, easy to use, and worth every penny!"

*Derek Sample, V.P./Senior Mixer,
The Bakery Digital Sound & Vision, North Hollywood, CA*

SFX AUTOMATIC

Sfx Automatic gives you the tools you'll need for adding digitized audio from your private collections to your ServerSound centralized library. During the process of mapping the audio, *Sfx Automatic* automatically creates an "on-the-fly" database based on the names of the directory tree structure, and the audio file names. The newly mapped audio is then instantly available for everyone's use for word searches, auditioning, and downloading from the browser. An *editor* feature allows you to export this newly created database to any word processor for editing, and can

then be re-imported to the ServerSound system. *Sfx Automatic* has a built in feature that will automatically search for new audio. Editors can drop any new audio files they have created to the appropriate folders on any local hard drive or centralized hard drive array, and *Sfx Automatic* will then automatically add the new audio to the centralized library for everyone's use.

Sfx Automatic supports **AIFF**, **WAV**, **SDII**, **MPEG3** file formats, and **44100 khz** & **48000 khz** sample rates.
